No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

The sequences given in AAB47791-97 and AAM48259-AAM48270 represent the native forms of motifs derived from DNA polymerases used in the method of the invention. The method for reverse transcribing an RNA, comprises treating a transverse transcription reaction mixture which comprises that, a primer, a divalent cation, and a mutant thermoactive DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAM48270;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAM48270 standard; Peptide; 11 AA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RNA, a primer, a divalent cation, and a mutant thermoactive DNA, DNA polymerase. These motifs represent a conserved region which affects the fluorescein and cyanine family dyes. The method of the invention is provides improved reverse transcription/amplification reactions. The method concentrations relative to previous high temperature reverse transcription efficiency at lower enzyme transcription methods, and provide a wider range of usable salt concentrations. The use of the mutant DNA polymerase provides flatter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           reverse transcription extension rates, and consequently less time

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             stearothermophilus thermostable DNA polymerase clone Bst2 which lacks the complete 5'-3' exonuclease domain. The corresp. gene was constructed by ligating the HindIII-SalI fragment from the clone pdemBst2.1sst conty is end of the gene with the Styl-HindIII fragment of the clone pdemBst2.1sst conty pdemBst5'end conty. The 5' end of the DNA polymerase gene. The styl-HindIII fragment covers the mid-region of the gene up to and exonuclease domain. The remainder of the 5' exonuclease but not the 5'-3' reconstituted by the ligated and extended oilgonucleotides AAT04816-17.

The modified DNA polymerase can be used in primer extension reactions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          polymerase. These motifs represent a conserved region which affects DNA polymerase's ability to incorporate dideoxynucleotides labelled fluorescein and cyanine family dyes. The method of the invention is provides improved reverse transcription/amplification reactions. The method concentrations relative to previous high temperature reverse concentrations relative to previous high temperature reverse
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          transcription methods, and provide a wider range of usable salt concentrations. The use of the mutant DNA polymerase provides fast reverse transcription extension rates, and consequently less time
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       needed for the reaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Local Similarity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 LAQNLNITRKE 11

                                                                                                                                                                                                                              stearothermophilus strain DNA polymerase. The heat stable DNA polymerase can be used in a method for the replication of a DNA chain. It can also be used in a method for the determination of the sequence of DNA chain. As the DNA polymerase has a proof reading 3'-5' exonuclease activity, possible mismatches of base pairing that occurs in current methods of DNA sequence determination of a DNA clone can be avoided.

It is encoded by a DNA construct (AAT36360) obtd. by PCR cloning of genomic DNA using a primer (AAT60826) based on the large fragment N-terminal sequence (AAW10599). Recombinant Bst Pol I large fragment can be produced in transformed bost cells, esp. as a fusion protein with mallose binding protein. It is thermophilic, retaining its activity at 65 deg, and is useful for nucleic acid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence, clone 4F, encodes a Taq DNA polymerase enzyme that has normal 5' nuclease activity, but reduced synthetic ability. This sequence was derived from the mutTaq construct described in AAT70343. The entire mutTaq gene was cut from the plasmid, and cloned into pET-3c. This clone was digested with BstXI and BamHI, at unique sites. The 3' overhang of BstXI was trimmed to a blunt end, while the overhang of BamHI was filled in. The blunt ends were ligated together. This resulted in an in-frame deletion of 903 nucleotides. The enzyme encoded by the present protein is also referred to as Cleavase BB.

Thermostable structure-specific nuclease(s) - characterisation of nucleic acid sequences and acid sequences and used for detection and d variations in nucleic

Example 2; Page 245; 457pp; English

NA. It relates to methods for forming a NA cleavage structure on a target sequence and cleaving the NA cleavage structure in a site-specific manner. The 5' nuclease activity of various enzymes (see AAW24210-13) is used to cleave the target-dependent cleavage structure, thereby indicating the presence of specific NA sequences or specific variations of them. structure-specific nuclease preferred for use in nucleic acid cleavage methods of the invention. Mutant genes (AAT76644-47) were constructed in order to determine which portions of the Taq polymerase domain can be altered without eliminating 5' nuclease altered Thermus aquaticus DNA polymerase (Taq) gene in which nucleotides 875-1778 of the wild-type gene coding sequence are deleted. Mutant gene mutTag (see AAT76643) was used as the starting material for the construct. Cleavase BB is a thermostable activity. The invention relates to means for the detection and characterisation of nucleic acid (NA) sequences and variations This DNA sequence, denoted clone 3F or Cleavase BB, comprises an

The method amplifies the detection molecule rather than the target itself, is less subject to contamination than exponential
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DNAP that has reduced synthetic activity (see AAV65783-86). Clearage of the clearage structure by the nuclease indicates the presence of specific nucleic acid sequences or specific variants. The invention further relates to methods for the separation of nucleic acid molecules based on charge, methods for the detection of non-target clearage products via the formation of a complete and activated protein binding region, and methods for the detection of nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  characterisation of nucleic acid sequences, and variations in nucleic acid sequences. It also relates to methods for forming a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This nucleotide sequence (clone 3F) codes for a thermostable nuclease (Cleavase BB) derived from the DNA polymerase (DNAP) of Thermus aquaticus (Taq). In comparison to the wild-type Taq DNAP sequence (see AAV65779), it contains an in-frame deletion of 903
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Detecting target nucleic acid by sequence-specific cleavage of complex with two specific oligonucleotides - used to detect

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a thermostable 5' nuclease derived from a thermostable polymerase modified to have reduced synthetic activity, where the 5' nuclease is capable of cleaving a linear nucleic acid duplex structure to create a single, single-stranded cleavage product. The nuclease, designated Cleavase BB, is used in a method for detecting the presence of a nucleic acid molecule. The method is used for the specific detection of nucleic acid sequences, via a cleavage-based procedure, but without the need for amplification of target sequences. Thermostable polymerases, altered to have nuclease, but not polymerase activity are preferably used due to their specificity. The cleavage product specifically formed is detected, preferably by the use of radioactively labelled oligonucleotides. These can be used in e.g. forensic testing or paternity determination.

Thermostable DNA polymerases are useful in many recombinant DNA techniques, esp. uncleic acid amplification by PCR, self-sustained sequence replication (SSR) and high temp. DNA sequencing. The absence of 5'-3' connuclease activity may facilitate higher sensitivity allelic discrimination in a combined polymerase ligase chain reaction (PLCR) casay. An enhanced amt. of 5'-3' exonuclease activity may be desirable in enzymes used in homogeneous assays for the amplification conditions of a target nucleic acid sequence. Mulation of the DNA cencoding particular regions of the enzymes can be used to prepare a considered particular regions of the enzymes can be used to prepare a complete lack of activity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Alignment Scores:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  nucleic acid amplification by PCR, self-sustained sequence replication (SSR) and high temp. DNA sequencing. The absence of replication (SSR) and high temp. DNA sequencing. The absence of 5'-3' nuclease activity may facilitate higher sensitivity allelic discrimination in a combined polymerase ligase chain reaction (PLCR) assay. An enhanced amt. of 5'-3' exonuclease activity may be desirable in enzymes used in homogeneous assay son the amplification and detection of a target nucleate acid sequence. Mutation of the DNA encoding particular regions of the enzymes can be used to prepare

The mutation designated pTHA392 causes the polymerase enzyme produced to exhibit a different amt. of 5'.3' exonuclease activity than the native enzyme. Thermostable DNA polymerases are useful in many recombinant DNA techniques, esp. nucleic acid amplification by PCR, self-sustained sequence replication (SSR) and high temp. DNA sequencing. The absence of 5'.3' nuclease activity may facilitate higher sensitivity allelic discrimination in a combined polymerase ligase chain reaction (PLCR) assay. An enhanced amt. of 5'.3' exonuclease activity may be desirable in enzymes used in homogeneous assays for the amplification and forter through the second content of t
                                                                                                                                                                                                                                                                                    Thermostable DNA dependent polymerase; nuclease activity; "ag polymerase; mulant; Polymerase Chain Reaction, PCR, N-terminal domain; proteolytic; thermal stability; hydrophilic solution; sequencing; labeling; diagnosis; genetic disorder; primer driven mutagenesis; identification of pathogen; mutational analysis; forensic identification; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 detection of a target nucleic acid sequence. Mutation of the DNA encoding particular regions of the enzymes can be used to prepare a range of recombinant proteins having 5'-3' exonuclease activity to a complete lack of activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Thermostable DNA polymerases with altered 5'-3' exo nuclease activity - having conserved regions mutated or deleted, for in e.g. PCR, sequencing and detection assays
                                                                                                                                                                                                     Thermus aquaticus.

                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is the DNA encoding a novel, thermostable DNA dependent, mutant Taq polymerase-1 enzyme. The N-terminal domain of polymerase includes a sequence of 9 amino acids, that has 40-50% sequence identity with residues 280-288 of native Thermus aquaticus polymerase, Taq. The residues 10-53 of encoded by this sequence is identical to residues 289-832 of Taq polymerase. This sequence has ignificant nuclease activity, but good proteolytic and thermal stabilities and improved solubility in hydrophilic solutions. This sequence is used for synthesis of polymucleotides, particularly in polymerase chain reaction (PCR) based processes, like sequencing, labeling, primer-driven mutagenesis, diagnosis of genetic disorders, identification of pathogens, mutational analysis and forensic

FY2 is the T. aquaticus DNA polymerase lacking pref. the 271-272 N-terminal amino acids and having the amino acid at position 667 of the wild type (Phe) replaced by Tyr. FY3 contains 562 amino acids with a Met at position 1 and Ala at position 2, corresponding to the Met and Ala of positions 271 and 272, respectively, of the wild type enzyme. FY4 corresponds to the T. thermophilus DNA polymerase lacking the N-terminal 274 amino acids having a Phe to Tyr replacement at position 396 (position 669 of the wild type enzyme).
New enzymatically active Thermus DNA polymerase(s) - having a tyrosine at a position equivalent to 667 of Taq DNA polymerase and lacking 5' to 3' exonuclease activity
                                                                                                             WPI;

polymerase having a Tyr residue at a position corresponding to Taq DNA polymerase residue 667 in its dnmp binding site, and lacking 5' to 3' exonuclease activity as a result of an N-terminal deletion. The polymerases can be used for the sequencing of DNA, either by manual automated means.
                                                                                                                                                                                                                                                                                                                                                         Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1219 CTCTCCCAGGAGCTAGCCATCCCCTACGAAGAA 1251
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              the wild type (Phe) replaced by Tyr. FY3 contains 562 amino acids with a Met at position 1 and Ala at position 2, corresponding to the Met and Ala of positions 271 and 272, respectively, of the wild type enzymc. FY4 corresponds to the T. thermophilus DNA polymerase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            P-PSDB; AAY00886

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 1686 BP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    FY2. FY3 and FY4 (see AAY47959 to AAY47961) are new thermostable DNA polymerases providing improved results in DNA sequencing reactions. FY2 is the T. aquatious DNA polymerase lacking pref. the 27:-272 N-terminal amino acids and having the amino acid at position 667 of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (AMSH ) AMERSHAM LIFE SCI INC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match
The sequences given in AAB47791-97 and AAM48259-AAM48270 represent the native forms of motifs derived from DAA polymerases used in the method of the invention. The method for reverse transcribing an RAA, comprises treating a transverse transcription reaction mixture which comprises the
                                                                                                                       Reverse transcribing an RNA, comprises performing a reverse transcriptase polymerase chain reaction amplification of a mixture using a mutant thermoactive DNA polymerase
                                                                                    Disclosure; Page 7; 23pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           polymerase. These motifs represent a conserved region which affects the DNA polymerase's ability to incorporate dideoxynucleotides labelled with fluorescein and cyanine family dyes. The method of the invention is useful in reverse transcription/amplification reactions. The method provides improved reverse transcription efficiency at lower enzyme
                                                                                                                                                                                                WPI; 2002-076891/11.
                                                                                                                                                                                                                               Schoenbrunner NJ,

             polymerase. These motifs represent a conserved region which affects the DNA polymerase's ability to incorporate dideoxynucleotides labelled with fluorescein and cyanine family dyes. The method of the invention is useful in reverse transcription/amplification reactions. The method provides improved reverse transcription efficiency at lower enzyme concentrations relative to previous high temperature reverse transcription methods, and provide a wider range of usable salt
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               polymerase. These motifs represent a conserved region which affects the DNA polymerase's ability to incorporate dideoxynucleolides labelled with fluorescein and cyanine family dyes. The method of the invention is useful in reverse transcription/amplification reactions. The method provides improved reverse transcription efficiency at lower enzyme concentrations relative to previous high temperature reverse transcription methods, and provide a wider range of usable salt concentrations. The use of the mutant DNA polymerase provides itsister.
transcription methods, and provide a wider range of usable salt concentrations. The use of the mutant DNA polymerase provides faster \alpha
                                                                                                                                               RNA, a primer, a divalent cation, and a mutant thermoactive DNA
                                                                                                                                                                                   The sequences given in AAB47791-97 and AAM48259-AAM48270 represent the native forms of motifs derived from DNA polymerases used in the method of the invention. The method for reverse transcribing an RNA, comprises
                                                                                                                                                                                                                                                                  Disclosure; Page 7; 23pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match
                                                                                               Sequence
                                                                                                                                                                  DNA polymerase's ability to incorporate dideoxynuclectides labelled with fluorescein and cyanine family dyes. The method of the invention is useful in reverse transcription/amplification reactions. The method provides improved reverse transcription efficiency at lower enzyme concentrations relative to previous high temperature reverse transcription methods, and provide a wider range of usable salt concentrations. The use of the mutant DNA polymerase provides faster
                                                                                                                                                                                                                                                                                                                         of the invention. The method for reverse transcribing an RNA, comprises treating a transverse transcription reaction mixture which comprises the RNA, a primer, a divalent cation, and a mutant thermoactive DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                        Disclosure; Page 7; 23pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                  oligonucleotide containing a human p53 gene sequence or alternatively, microbial gene sequences. Cleavage products are compared to the cleavage products of reference gene sequences. The method is used for detecting mutation in the human p53 gene; for identifying strains of microorganisms, especially bacteria selected from the the group of members of the genera Campylobacter, Escherichia, Mycobacterium, Salmonella, Shigella and Staphylococcus. The method may also be used for the identification of viruses, especially hepatitis C virus and simian immunodeficiency virus.
                                                                                                                                                                                                                                                                                                             Thermus aquaticus (Taq) DNA polymerase was amplified using two primers (AAT27679, AAT27680). The Taq polymerase DNA was inserted into the BamHI restriction site of the expression vector pET-3c and mutant genes were created from that construct. This mutant was created after the vector was digested with BStXI and BamHI. The DNA was after the vector was digested with BStXI and BamHI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Brow MAD, Dahlberg
Oldenburg MC, Olive
                                                                                                                                                                                                                              then treated with the Klenow fragment of DNAPEC1 to trim both overhangs to blunt ends which were then ligated together, result in an in frame deletion of 903 nucleotides. This mutant Tag polymerase is also referred to as the Cleavase BB enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cleavage of nucleic acids using an enzyme, especially a nuclease selected from the group consisting of Cleavase (RTM) BN enzyme, Thermus aquaticus DNA polymerase, Thermus thermophilus DNA
                                                                                                                                                                                       Sequence

                                                                                                                                                                                                                                                                                                                               sequence replication (SSR) and high temp. DNA sequencing. The absence of 5'-3' nuclease activity may facilitate higher sensitivity allelic discrimination in a combined polymerase ligase chain reaction (PLCR) assay. An enhanced amt. of 5'-3' exonuclease activity may be desirable in enzymes used in homogeneous assays for the amplification and detection of a target nucleic acid sequence. Mutation of the DNA encoding particular regions of the enzymes can be used to prepare a range of recombinant proteins having 5'-3' exonuclease activity to a complete lack of activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       28-SEP-1990;

                                                                                                                                                                                                                                                                                                                                                                            The sequence is that of a mutant of Thermus species 205 polymerase mutant MET ALA 292 TWO5, having a different ant. of 5'-3' exonuclease activity than the native enzyme. Thermostable DNA polymerases are useful in many recombinant DNA techniques, esp. nucleic acid amplification by PCR, self-sustained sequence replication (SSR) and high temp. DNA sequencing. The absence of 5'-3' nuclease activity may facilitate higher sensitivity allelic discrimination in a combined polymerase ligase chain reaction (PLCR) assay. An enhanced amt. of 5'-3' exonuclease activity may be desirable in enzymes used in homogeneous assays for the amplification and detection of a target nucleic acid sequence. Mutation of the DNA encoding particular regions of the enzymes can be used to prepare a range of recombinant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          28-SEP-1990;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequence is that of a mutant of Thermus thermophilus polymerase mutant MET-ALA 292 Tth. having a different amt. of 5'-3' exonuclease activity than the native enzyme. Thermostable DNA polymerases are useful in many recombinant DNA techniques, esp. nucleic acid amplification by PCR, self-sustained sequence replication (SSR) and high temp. DNA sequencing. The absence of 5'-3' nuclease activity may facilitate higher sensitivity allelic discrimination in a combined polymerase ligase chain reaction (PCCR) assay. An enhanced amt. of 5'-3' exonuclease activity may be desirable in enzymes used in homogeneous assays for the amplification and detection of a target
                             Thermus aquaticus; Taq; DNA polymerase; polymerisation; PCR protocol; genetic engineering.
                                                                                                                                                                                                                                                                                                                                                                                                                     nucleic acid sequence. Mutation of the DNA encoding particular regions of the enzymes can be used to prepare a range of recombi proteins having 5'-3' exonuclease activity to a complete lack of activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Thermostable DNA polymerases with altered 5'-3' exo nuclease activity - having conserved regions mutated or deleted, for use in e.g. PCR, sequencing and detection assays
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Key Location/Qualifiers Misc-difference 1..2

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         associated. The polymerase is thermostable and possesses new or improved catalytic properties compared to known nucleic acid polymerases. The polymerase eliminates the need to specifically develop multi-enzyme reaction mixtures, which are often difficult to optimise and expensive to use. The polymerase facilitates rapid, efficient and accurate generation of nucleic acid molecules, particularly in regard to PCR protocols. The polymerase is also useful for nucleic acid polymerisation which is useful in genetic engineering techniques and molecular biology. The protein sequence is Thermus aquaticus (Taq) DNA polymerase.

The present amino acid sequence is a novel, thermostable DNA dependent mutant Taq polymerase-1 enzyme. The N-terminal domain, includes a sequence of 9 amino acids, that has 40-50% sequence identity with residues 280-280 of native Thermus aquaticus polymerase, Taq. The residues 10-53 of this polymerase sequence is identical to residues 289-832 of Taq polymerase. This sequence has no significant nuclease activity, but good proteolytic and thermal stabilities and improved solubility in hydrophilic solutions. This sequence is used for synthesis of polymucleotides, particularly in polymerase chain reaction (PCR) hased processes, like sequencing, labeling, primer-driven mutagenesis, diagnosis of genetic disorders, identification of pathogens, mutational analysis and forensic identification.
DNA polymerase and formulations comprising it - allowing the amplification of sequences up to 35 kilobases and reducing the mutagenicity generated by the PCR process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Thermostable polymerase; Klentay 278
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel enzyme, particularly useful in polymerase chain reaction

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             X0000000000000000XX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC Kientaq-278 is a thermostable polymerase lacking 3'-exonuclease activity. The AA sequence is substantially the same AA sequence as CC Thermus aquaticus DNA polymerase but lacks the N-terminal 280 AAS. A CC DNA encoding such a polymerase is claimed, as is the polymerase CC itself. The polymerase also has substantially the same AA sequence CC as that of Thermus flavus, but excludes the N-terminal 279 AAs. Primers AAO79543, AAO79553 and AAO79554 can be used for the CC amplification of the gene for KlenTaq-278. Essentially the same CC primers can be used for the amplification of the analagous gene from CC Thermus flavus (see AAO79543, AAO79556, AAO7957). An intiator Met and a CC Gly occupy the first two N-terminal posns of Klentaq-278, CC DNA polymerase, followed by the AA sequence of Mr. aquaticus CDNA polymerase, followed by the AA sequence of Mr. aquaticus CDNA polymerase, beginning with the AA residue at posn. 281.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

This sequence has no significant nuclease activity, but good proteolytic and thermal stabilities and improved solubility in hydrophilic solutions. This sequence is used for synthesis of polymucleotides, particularly in polymerase chain reaction (PCR) based processes, like sequencing, labeling, primer-driven mutagenesis, diagnosis of genetic disorders, identification of pathogens, mutational
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present amino acid sequence is a novel, thermostable DNA dependent mutant Taq polymerase-2 enzyme The N-terminal domain, includes a sequence of 15 amino acids, that has 40-50% sequence identity with N-terminal residues of native Thermus aquaticus polymerase, Taq.

                                                                                                                                                                                                                                                                                                                         The present sequence is that of a truncated Thermus flavus DNA polymerase I, which is exonuclease-free, and corresponds to amino acids 275 to 834 of AAR96203. A vector lacking the 5' one-third of the T. flavus DNA polymerase I was generated. The ATC startcodon of lacZ was brought in frame with the DNA encoding amino acids 239 to 834 of the Tfl DNA pol I holoenzyme using site-directed mutagenesis. This was used to generate the present sequence. This recombinant polymerase is thermostable and can be used in applications such as DNA sequencing, polymerase chain reaction, (universal) thermal cycle labelling and ligase chain reaction.
                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       04-NOV-1994;
